

ABSTRACT OF THE DISCLOSURE

The present invention provides a projector that is capable of correcting an image distortion due to off-axis projection of an image in a horizontal direction and in a vertical direction onto a screen. The projector includes: an image distortion adjustment module that adjusts a display video signal, which represents an image to be projected by the projector, according to values of a horizontal correction parameter used for correcting an image distortion in the horizontal direction and a vertical correction parameter used for correcting an image distortion in the vertical direction, so as to correct an image distortion arising in at least one of the horizontal direction and the vertical direction; a two-dimensional input unit that outputs a two-dimensional operation signal, which is mapped to the horizontal correction parameter and to the vertical correction parameter, in response to a user's operation; and a parameter setting module that sets the values of the horizontal correction parameter and the vertical correction parameter in the image distortion adjustment module in response to the two-dimensional operation signal. This arrangement effectively enhances operatability in the process of correcting the image distortion due to off-axis projection.
